# EpiData EpiData is a program for DataEntry.

EpiData works on Machintosh Computers with RealPc Emulator and PC´s with Windows 95/98/NT/2000/ME

For more information: www.epidata.dk

EpiData

File Check data Data in/out Document Window Help

1. Define data ▼ ➡️ 2. Make datafile ▼ ➡️ 3. Add checks ▼ ➡️ 4. Enter data ➡️ 5. Document ▼ ➡️ 6. Export data ▼

The work process is as this (optional parts are dotted):

Define datastructure and layout of DataEntry

Preview DataForm and simulate dataentry

Change structure or layout when necessary

Define checks and jumps

- attach labels to variables
- range checks
- define conditional jumps (filters)
- consistency checks across variables

Attach labels to values
- Reuse from collection
- Define new

Create datafile

Enter all the data.

Enter data a second time (all records or part of it)

Compare dataset one with dataset two

Correct errors based on original paper forms

Dataset is ready.
- archive copy with documentation.
- export data for analysis

Generate documentation:
List of data, codebook and variable overview including defined checks and labels
